

CONTROLS // IT SECURITY

CONTROL YOUR NETWORK WITH SECURE NETWORK

Increasing digitization and the need for access to OT networks increase the risk of cyber incidents. It is therefore important to continuously close IT security gaps and actively monitor which devices have access to the network.

Do you have a comprehensive overview of the threat landscape in your network?

With our Secure Network concept, we offer a review and update of your OT environment, while it is also possible to add network monitoring to your setup.

It is expected that there may be devices in an OT environment that are several updates behind and may be time-consuming to update, and in the worst case, they may become defective. Equipment that can no longer be updated will be isolated or replaced.

Secure Network gives you:

- Security gaps are continuously closed, making it more difficult for cybercriminals to compromise the devices.
- Review of the network, where you become familiar with the equipment's lifespan, vulnerabilities, and possible security measures.
- Monitoring of the network, where you are alerted to vulnerabilities and unknown devices appearing in your network.
